	C2. Documentation			
		Yes	No	N/A
Α	Instructions for resetting the system and silencing alarm signals.			
В	Instructions for silencing the trouble signal and action to be taken when the trouble signal sounds.			
С	Description of the function of each operating control and indicator on the fire alarm control unit.			
D	Description of the area or fire zone protected by each alarm detection circuit (this may be in the form of a list or plan drawing).			
Е	Description of alarm signal operation.			
F	Description of ancillary equipment controlled by the fire alarm system.			
G	In systems that provide logical control of a smoke control system, documentation is on site and includes a sequence of operation of the smoke control system. Smoke control installed in accordance with Measure:			
	Building diagrams are on site that clearly indicate the type and location of			
Н	all smoke control equipment (fans, dampers, etc.).			Ш
Recomr	mended Additional Documentation (not mandated by the Standard):	Yes	No	
	Additional documentation relating to smoke control measures in the building is appended to this report.			
	Fire Safety Plan documentation is on site.			
	Instructions to Occupants/Evacuation Floor Plans are posted.

	C3. Field Device and Related Circuits – Test and Inspection	n		
		Yes	No	N/A
Α	Correct field termination and wiring size.			
В	Correct circuit polarities.			
С	An open circuit fault on a conventional device circuit causes a trouble signal.			
D	Removal of any active or supporting field device circuit causes a trouble signal.			
Е	One contact device and one non-contact device tested for operation and annunciation at the control unit or transponder, when using a field verifying device.			
F	Class "A" circuits serving conventional field devices tested for the capability of providing an alarm signal on each side of an open circuit fault connection at the electrically most remote point in the circuit.			
G	Ground fault indications occur when tested at the electrically furthest field device, and do not result in normal to off-normal status change conditions.			
Н	Field device at the electrically furthest point from the power source (in every circuit) receives rated power in accordance with the manufacturer's specifications.			
	Replaceable over-current devices are of the correct rating.			
J	Where a power buss circuit serves more than one fire alarm zone, a single fault (open circuit fault, short circuit fault or ground fault) on the power circuit does not prevent the normal operation of input or output field devices in more than one fire alarm zone.			
К	Conductor type and wire gauge are in accordance with the equipment manufacturer's installation wiring requirements at all system termination points.			
L	Confirm that where multiple strand optical fibre cable used with a fire alarm system is not dedicated to the fire alarm system, the fire alarm system shall continue to function as required despite impairment to other systems which may share the cable.

	C4. Data Communication Link Testing			
	Unit/Transponder Field Location:			
Contr	ol Unit/Transponder Identification: DCL Identification:			
	DCL Identification:	Yes	No	N/A
Α	Each system abnormal condition specified in Table 1 – Abnormal System Conditions, tested for each data communication link at the control unit or transponder.			
В	Tests for alarm and trouble received under a single ground fault condition conducted on each conductor of that data communication link independently.			
С	Each conductor in a data communication link, Class A (DCLA) tested for the capability of providing an alarm signal on each side of a single open circuit fault condition.			
D	Where a data communication link serves devices on more than one floor area, impose a wire-to-wire short circuit fault within each floor area and confirm receipt of trouble and alarm condition from another floor area.			
E	Where fault isolation modules are installed in data communication links serving field devices, wiring shorted on the isolated side, annunciation of the fault confirmed, and then a device on the source side operated, and activation confirmed at the control unit or transponder.			
F	Where fault isolation in data communication links is provided between control units or transponders, the field wiring shorted between each pair of control units or transponders, in turn, annunciation of the fault confirmed and operation outside the shorted section is confirmed.			
Contro	Unit/Transponder Field Location:

C5. Control Unit or Transponder Record

(Reference Clause 5.1.1)

	C5.1 Control Unit or Transponder Tests			
	Control Unit/Transponder Field Location:			
	Control Unit/Transponder Identification:			
		Yes	No	N/A
Α	Power 'on' visual indicator operates.			
В	Common visual trouble signal operates.			
С	Common audible trouble signal operates.			
D	Trouble signal silence switch operates.			
Е	Main Power supply failure trouble signal operates.			
F	Ground fault tested on positive and negative initiates trouble signal.			
G	Alert signal operates.			
Н	Alarm signal operates.			
- 1	Automatic transfer from alert signal to alarm signal operates. Time:			
J	Manual transfer from alert signal to alarm signal.			
K	Automatic transfer from alert to alarm signal cancel (acknowledge) operates on a two stage system.			
L	Alarm signal silence inhibit function operates.			
М	Alarm signal manual silence operates.			
N	Alarm signal silence visual indication operates			
0	Alarm signal and visible signal devices, when silenced, automatically reinitiate upon subsequent alarm. ☐ In same zone ☐ In other zone/circuit			
P	Alarm signal silence automatic cut-out timer. Time:			
	Audible, visual, alert, and alarm signals programmed and operate as per			
Q	manufacturer's design and specification.			
R	Input circuit alarm and supervisory operation including audible and visual indicator operates.			
S	Input circuit supervision fault causes a trouble indication.			
Т	Output circuit alarm indicators operate.			
U	Output circuit supervision fault causes a trouble indication.			
V	Visual indicator test (lamp test) operates.			
W	Coded signal sequence operate not less than the required number of times and the correct alarm signal thereafter.			
Х	Coded signal sequences are not interrupted by subsequent alarms.			
Υ	Ancillary device control circuit is rated for the intended purpose.			
Z	Ancillary device by-pass results in trouble signal.			
AA	Input circuit to output circuit operation including ancillary device circuits (refer to Appendix C5.12, Ancillary Device Circuit Test), for correct program operation as per design and specification.			
BB	Fire alarm reset function operates.			
CC	Main power to emergency power supply transfer operates.			
DD	Control unit or transponder enclosure bonded to ground.			
EE	Status change confirmation feature (smoke detectors only) verified.			
Recomr	nended Additional Testing (not mandated by the Standard):	Yes	No	N/A
	ouble, & supervisory relays function correctly.			
	disconnecting switch installed?			
	AN4-S524 restricts this, but some AHJ's will accept it.			
A YES	answer here must be noted in the "Comments/Remarks" section of this report.)

C5.13 Interconnection to the Fire Signal Receiving Centre						
	Communicator Location:					
Circu	it Disconnect Means Location:			_		
Circu	it Panel/Breaker Identification:					
		Yes	No	N/A		
А	The fire signal receiving centre transmitter is integral to the fire alarm control unit.	Ш				
В	The fire signal receiving centre transmitter is located remotely from the fire alarm control unit.					
С	Where an interconnection between the fire alarm control unit and a separate fire signal receiving centre transmitter is provided, a demarcation terminal box with a minimum of twelve (12) terminals is installed.					
D	The demarcation terminal box is located in the same room as the fire alarm control unit it is connected to.					
Е	The demarcation terminal box is labeled "Fire Alarm Demarcation" and/or "Limitation D'Alarme Incendie".					
F	The conductors installed between the fire alarm control panel and the demarcation terminal box complies with Section 3.4 of CAN/ULC-S524-06.					
G	Tested and confirmed operation of alarm relay.					
Н	Tested and confirmed operation of trouble relay.					
I	Tested and confirmed operation of supervisory relay.					
J	Confirm that the alarm transmission to the fire signal receiving centre is received.					
K Confirm that the supervisory transmission to the fire signal receiving centre is received.						
L Confirm that the trouble transmission to the fire signal receiving centre is received.						
Record the name and telephone number of the fire signal receiving centre.						
M						
	Address:					
N	Operation of the fire signal receiving centre transmitter bypass means results in a specific trouble indication at the fire alarm control unit or transponder and transmits a					
IN	trouble signal to the fire signal receiving centre.	Ш				
Addit	ional Information (not mandated by the Standard):	Yes	No	N/A		
	mmunicator is installed in accordance with CAN/ULC-S561-13.					
	e signal receiving centre is ULC Listed.					
	e signal receiving centre ULC certification number is:					
The communicator is being tested in accordance with CAN/ULC-S561-13.						
Supporting documentation attesting to this is on site and has been reviewed.						
The ULC "Central Station Fire Protective Signalling Service" Certificate is valid.						
The ULC "Central Station Fire Protective Signalling Service" Certificate expires on:						
The last inspection noted on the Certificate occurred on:						
The communicator has been reset following completion of testing.						
The communicator has been placed back into service.						
The communicator is trouble free.						

ADDITIONAL NOTES:

- 4. Smoke detector sensitivity measurement should be recorded in the "Remarks" column of the Individual Device Test Record. Analog smoke detectors may report their obscuration level (sensitivity) to the fire alarm's common control. This information should be retrieved and recorded in the "Remarks" column.
- 5. Status change, including time delay (where applicable), should be recorded in the "Remarks" column.
- 6. Duct smoke detector pressure differential should be confirmed and recorded in the "Remarks" column. Detector tubes must be pulled and their alignment confirmed if results indicate any abnormalities. Record any discrepancies in the "Remarks" column.
- 7. Time delay setting of water flow switch should be recorded in the "Remarks" column.
- 8. Sprinkler supervisory switches should cause a "trouble" condition to be annunciated. This should be a latching type trouble (or "supervisory trouble") only restorable by pressing "Reset" on the fire alarm control panel. Exceptions must be noted in "Comments".
- 9. Upper and lower pressure setting of supervisory devices should be recorded in the "Remarks" column.
- 10. Low temperature setting should be recorded in the "Remarks" column.
- 11. Identify the specific ancillary devices in the "Remarks" column.
- 12. Where possible, identify the date a fire detector is changed. If housing discolouration is noted, attempt to identify the source and note the date of manufacture. Heat detectors whose labels are missing, faded and unreadable, or painted are considered failed and require replacement. This information should be noted in the "Remarks" column.
- 13. Identify type and function of each addressable device in the "Remarks" column.
- 14. Exposure to charging currents in excess of 100 mA will significantly shorten the service life of Ni-Cad and sealed lead acid batteries.
- 15. Relays tied to listed fire alarm equipment initiating/supervisory circuits must be properly supervised. Note exceptions in "Comments".
- 16. The system's documentation should provide information concerning the number of addressable devices that are connected to each isolator. Ensure this number does not exceed the Manufacturer's requirements. Any exceptions should be noted in "Comments".
- 17. The building owner/manager must maintain the records for the Verification on site for inspection by the local authority.
- 18. Operation of each annunciator or sequential display must be confirmed visually.
- 19. Stand-by batteries that are remotely located more than twelve (12) meters from the Fire Alarm Common Control must be fused (or installed in accordance with the manufacturer's recommendations or requirements).

Any exceptions to the above are noted in the "Remarks/Comments" area on the last page of this report.
